ABSTRACT:

PURPOSE: To provide the magnetic superfine particle film function element formed with a magnetic superfine particle film on a substrate and the process for production of the magnetic superfine particle film function element for production thereof.

CONSTITUTION: Superfine particles of $5\text{Fe}(\text{OH})33\text{Y}(\text{OH})3$ or superfine particles of $[5\text{Fe}(\text{OH})3] [(3-x-y)\text{Y}(\text{OH})3] [x\text{M}(\text{OH})3] [y\text{N}(\text{OH})3]$ are formed by using an alkoxide method and are stably dispersed into an org. solvent. After the colloidal soln. prepd. in such a manner is applied on the substrate 100, the substrate 100 is calcined, by which the film 200 of the crystalline YIG superfine particles (crystalline YIG compd. superfine particles) is formed on the substrate 100. The magnetic superfine particle film function element operating as a magnetic thin film function element or magnetic thick film function element is realized.

BASIC-ABSTRACT:

Ultrafine particle films (pref. of YIG (F35Y3012) opt. also contg. Bi, Gd, In and one of rare earth elements) are formed on a transparent or opaque substrate.

USE - The element operates as a magnetic thin film element or magnetic thick film element.
